

Integrated Power Module and Smart Junction Box Diagnosis

Chrysler and Ford vehicles have been using an enhanced "fuse box" which does a lot more than circuit control and protection. These modules can be integrated with the data bus and they can be the cause of many symptoms including inoperative components, no starts, and codes. You will need to be able to diagnose faults and be sure a replacement is needed before you order one of these expensive devices. Some of these modules will require programming before they will work. Be prepared to diagnose and configure these modules when they go bad.

Attend this class to learn about:

- How to diagnose power module issues
- Interpreting data and service information
- Replacement steps for power modules
- Diagnostic tips

Don't forget your registration card!

Date: September 5th 2018

Time: 5:30pm to 9:30pm

Location: Smith Auto Training Center

Cost: \$74.99
